AGENCY: Fish and Wildlife Service, Interior.

ACTION: Notice of document availability.

At present, the species is restricted to a few localities in southwestern, southern and eastern Puerto Rico, and to Mona and Monito Islands. Nesting yellow-shouldered blackbirds use a variety of habitats: mud flats and salinas, mangrove forests and cays, coastal upland dry forest, palm trees, suburban areas, artificial structures and coastal cliffs. The species is threatened by shiny-cowbird parasitism, habitat destruction and modification, nest predation, parasitism and diseases. SUPPLEMENTARY INFORMATION:

Background

Restoring an endangered or threatened animal or plant to the point where it is again a secure, self-sustaining member of its ecosystem is a primary goal of the U.S. Fish and Wildlife Service's endangered species program. To help guide the recovery effort, the Service is working to prepare recovery plans for most of the listed species native to the United States. Recovery plans describe actions considered necessary for conservation of the species, establish them, and estimate time and cost for implementing the recovery measures needed.

The Endangered Species Act of 1973 (Act), as amended (16 U.S.C. 1531 *et seq.*) requires the development of recovery plans for listed species unless such a plan would not promote the conservation of a particular species. Section 4(f) of the Act, as amended in 1988, requires that public notice and an opportunity for public review and comment be provided during recovery plan development. The Service and

other Federal agencies will also take these comments into account in the course of implementing approved recovery plans.

This Technical/Agency Draft is for the yellow-shouldered blackbird, which is endemic to the island of Puerto Rico. This species is endemic to Puerto Rico and Mona Island. In the past, this species was considered abundant and widespread in Puerto Rico. At present, the species is restricted to a few localities in southwestern, southern and eastern Puerto Rico, and to Mona and Monito Islands. A maximum of 500 individuals have been reported from southwestern Puerto Rico. Approximately 400 individuals are known from Mona Island, 20 individuals have been sighted in Salinas, and one individual was sighted in Roosevelt Roads Naval Station. Nesting yellow-shouldered blackbirds use a variety of habitats: mud flats and salinas, mangrove forests and cays, coastal upland dry forest, palm trees, suburban areas, artificial structures and coastal cliffs. The species is threatened by shiny-cowbird parasitism, habitat destruction and modification, nest predation, parasitism and diseases.

Public Comments Solicited

The Service solicits written comments on the recovery plan described. All comments received by the date specified above will be considered prior to approval of the plan.

Authority: The authority for this action is Section 4(f) of the Endangered Species Act, 16 U.S.C. 1533(f).

Dated: August 18, 1995.

Acting Field Supervisor.
