

reproductive capability of mating animals and data on systemic toxicity.

FFDCA section 408 provides that EPA may apply an additional safety factor for infants and children in the case of threshold effects to account for pre- and post-natal toxicity and the completeness of the database. Based on the current toxicological data requirements, the database relative to pre- and post-natal effects for children is complete. Further, for the chemical myclobutanil, the NOEL at 2.5 mg/kg/day from the rat study, which was used to calculate the RfD, is already lower than the NOELs from the developmental studies in rats and rabbits by a factor of approximately 4-fold.

The effects observed in the reproductive toxicity study suggest that there is no unique sensitivity for infants and children. Therefore, the data support a conclusion that an additional uncertainty factor is not warranted and that the RfD at 0.025 mg/kg/day is appropriate for assessing aggregate risk to infants and children.

Using the conservative exposure assumptions described above, it was concluded that the percent of the RfD that will be utilized by aggregate exposure to residues of myclobutanil ranges from 13.1% for adults up to 72.3% for non-nursing infants. Therefore, based on the completeness and reliability of the toxicity data and the conservative exposure assessment, EPA has already published a conclusion which indicates that there is a reasonable certainty that no harm will result to infants and children from aggregate exposure to myclobutanil residues.

#### F. International Tolerances

There are Codex maximum residue levels (MRL) established for residues of myclobutanil for apricot, cherry, peach, plum/prune (fresh), prune (dried), grapes, apples, and pears. Rohm and Haas company has proposed modifications to the current CXL for stone fruits only to accommodate US GAP.
