## NUCLEAR REGULATORY COMMISSION

[Docket No. 50-244]

### In the Matter of Rochester Gas and Electric Corporation; R.E. Ginna Nuclear Power Plant; Exemption

#### I

On December 10, 1984, the Nuclear Regulatory Commission issued Facility Operating License No. DPR-18 to

Rochester Gas and Electric Corporation (RG&E or the Licensee) for the R.E. Ginna Nuclear Power Plant. The license stipulated, among other things, that the facility is subject to all rules, regulations, and orders of the Commission.

#### II

In its letter dated June 12, 1997, the licensee requested an exemption from the Commission's regulations. Section 50.60 of Title 10 of the Code of Federal Regulations, "Acceptance Criteria for Fracture Prevention Measures for Lightwater Nuclear Power Reactors for Normal Operation," states that all lightwater nuclear power reactors must meet the fracture toughness and material surveillance program requirements for the reactor coolant pressure boundary as set forth in Appendices G and H to 10 CFR part 50. Appendix G to 10 CFR part 50 defines pressure/temperature (P/T) limits during any condition of normal operation, including anticipated operational occurrences and system hydrostatic tests to which the pressure boundary may be subjected over its service lifetime. It also states that the American Society of Mechanical Engineers Boiler and Pressure Vessel Code (ASME Code) edition and addenda specified in 10 CFR 50.55a are applicable. It is specified in 10 CFR 50.60(b) that alternatives to the described requirements in Appendices G and H to 10 CFR Part 50 may be used when an exemption is granted by the Commission under 10 CFR 50.12.

To prevent low-temperature overpressure transients that would produce pressure excursions exceeding the 10 CFR part 50, Appendix G, P/T limits while the reactor is operating at low temperatures, the licensee installed a low-temperature overpressure protection (LTOP) system. The system includes pressure-relieving devices called power-operated relief valves (PORVs). The PORVs are set at a pressure low enough so that if an LTOP transient occurred, the mitigation system would prevent the pressure in the reactor vessel from exceeding the 10 CFR part 50, Appendix G, P/T limits. To prevent the PORVs from lifting as a result of normal operating pressure surges (e.g., reactor coolant pump starting, and shifting operating charging pumps) with the reactor coolant system in a solid water condition, the operating pressure must be maintained below the PORV setpoint. Applying the LTOP instrument uncertainties required by the staff's approved methodology results in an LTOP setpoint that establishes an operating window that is too narrow to
