The invention provides compositions and methods directed to isolated α subunits of the 7TM protein CD97. CD97 is a heterodimer existing in three isoforms, namely three forms of α subunit and one invariant β subunit. The invention provides compositions and methods for detecting a subunit of CD97, a T-cell protein which is unregulated in activated T-cells and is involved in the onset and maintenance of inflammation and angiogenesis. The invention provides an isolated protein comprising a soluble CD97 α subunit, and an isolated nucleic acid encoding a soluble Cd97 α subunit protein. The invention also provides methods for identifying compounds which inhibit soluble CD97 α subunit expression. The invention may be used to inhibit angiogenesis associated with chronic inflammation in a mammal by administering a therapeutically effective amount of a CD97 antagonist. Another application includes determining the degree of inflammation at a site in a mammal with an antibody composition specifically reactive to a soluble CD97 α subunit. Further, it should be noted that these compositions and methods further have in vitro utility in the construction of proteins and subsequences thereof for the construction of antibodies, and nucleic acids and subsequences thereof for use as probes.

U.S. Patent 5,092,885 issued 03 Mar 92
Licensing Contact: Jaconda Wagner, 301/496-7735, ext. 284

Peptides with laminin activity, including YIGSR, are claimed. These peptides block angiogenesis, alter the formation of capillary structures by endothelial cells, prevent the formation of excess blood vessels in tissue and inhibit in vivo tumor cell colonization of tissues. These peptides can be used, among other things, to inhibit metastasis.

U.S. Patent 5,211,657 issued 18 May 93
Licensing Contact: Jaconda Wagner, 301/496-7735, ext. 284

This invention relates to peptides and derivatives thereof having laminin-like activity, as well as a pharmaceutical composition of the peptide. The peptides claimed include Serine-Isoleucine-Lysine-Valine-Alanine-Valine (SIKVAV). Methods for promoting increased adhesion and migration of epithelial cells is also disclosed. The peptides have wide usage in research, nerve regeneration and cancer treatment. For example, this invention may be useful as an adhesion and regeneration agent for nerve guides and as an adhesion agent for vascular prosthesis.
