§ 92.132 Calculations.

(a) *Duty-cycle emissions.* This section describes the calculation of duty-cycle emissions, in terms of grams per brake horsepower hour (g/bhp-hr). The calculation involves the weighted summing of the product of the throttle notch mass emission rates and dividing by the weighted sum of the brake horsepower. The final reported duty-cycle emission test results are calculated as follows:

$$(1)(i) E_{idc} = (\Sigma(M_{ij})(F_j)) / (\Sigma(BHP_j)(F_j))$$

Where:

E_{idc} = Duty-cycle weighted, brake-specific mass emission rate of pollutant i (i.e., HC, CO, NO_x or PM and, if appropriate, THCE or NMHC) in grams per brake horsepower-hour;

M_{ij} = the mass emission rate pollutant i for mode j;

F_j = the applicable weighting factor listed in Table B132-1 for mode j;

BHP_j = the measured brake horsepower for mode j.

(ii) Table B132-1 follows:

TABLE B132-1—WEIGHTING FACTORS FOR CALCULATING EMISSION RATES

Throttle notch setting	Test mode	Locomotive not equipped with multiple idle notches		Locomotive equipped with multiple idle notches	
		Line-haul	Switch	Line-haul	Switch
Low Idle	1a	NA	NA	0.190	0.299
Normal Idle	1	0.380	0.598	0.190	0.299
Dynamic Brake	2	0.125	0.000	0.125	0.000
Notch 1	3	0.065	0.124	0.065	0.124
Notch 2	4	0.065	0.123	0.065	0.123
Notch 3	5	0.052	0.058	0.052	0.058
Notch 4	6	0.044	0.036	0.044	0.036
Notch 5	7	0.038	0.036	0.038	0.036
Notch 6	8	0.039	0.015	0.039	0.015
Notch 7	9	0.030	0.002	0.030	0.002
Notch 8	10	0.162	0.008	0.162	0.008

(2) Example: For the line-haul cycle, for locomotives equipped with normal and low idle, and with dynamic brake, the brake-specific emission rate for HC would be calculated as:

$$E_{HCdc} = [(M_{HC1a})(0.190) + (M_{HC1})(0.190) + (M_{HC2})(0.125) + (M_{HC3})(0.065) + (M_{HC4})(0.065) + (M_{HC5})(0.052) + (M_{HC6})(0.044) + (M_{HC7})(0.038) + (M_{HC8})(0.039) + (M_{HC9})(0.030) + (M_{HC10})(0.162)] / [(BHP_{1a})(0.190) + (BHP_1)(0.190) + (BHP_2)(0.125) + (BHP_3)(0.065) + (BHP_4)(0.065) + (BHP_5)(0.052) + (BHP_6)(0.044) +$$

$$(BHP_7)(0.038) + (BHP_8)(0.039) + (BHP_9)(0.030) + (BHP_{10})(0.162)]$$

(3) In each mode, brake horsepower output is the power that the engine delivers as output (normally at the flywheel), as defined in § 92.2.

(i) For locomotive testing (or engine testing using a locomotive alternator/generator instead of a dynamometer), brake horsepower is calculated as:

$$BHP = HP_{out} / A_{eff} + HP_{acc}$$

Where:

HP_{out} = Measured horsepower output of the alternator/generator.

A_{eff} = Efficiency of the alternator/generator.
 HP_{acc} = Accessory horsepower.

(ii) For engine dynamometer testing, brake horsepower is determined from the engine speed and torque.

(4) For locomotive equipped with features that shut the engine off after prolonged periods of idle, the measured mass emission rate M_{i1} (and M_{i1a} as applicable) shall be multiplied by a factor equal to one minus the estimated fraction reduction in idling time that will result in use from the shutdown feature. Application of this adjustment

is subject to the Administrator's approval.

(b) *Throttle notch emissions.* This paragraph (b) describes the calculation of throttle notch emissions for all operating modes, including: idle (normal and low, as applicable); dynamic brake; and traction power points. The throttle notch (operating mode) emission test results, final reported values and values used in paragraph (a)(1) of this section are calculated as follows:

(1) Brake specific emissions (E_{ij}) in grams per brake horsepower-hour of each species i (i.e., HC, CO, NO_x or PM and, if appropriate, THCE or NMHC) for each mode j :

(i) $E_{\text{HC mode}} = \text{HC grams/BHP-hr} = M_{\text{HC mode}} / \text{Measured BHP in mode.}$

Where:

$M_{\text{HC mode}} = \text{Mass HC emissions (grams per hour) for each test mode.}$

(ii) $E_{\text{THCE mode}} = \text{THCE grams/BHP-hr} = M_{\text{THCE mode}} / \text{Measured BHP in mode.}$

(v) $E_{\text{NO}_x \text{ mode}} = \text{NO}_x \text{ grams/BHP-hr} = M_{\text{NO}_x \text{ mode}} / \text{Measured BHP in mode.}$

(vi) $E_{\text{PM mode}} = \text{PM grams/BHP-hr} = M_{\text{PM mode}} / \text{Measured BHP in mode.}$

(vii) $E_{\text{AL mode}} = \text{Aldehydes grams/BHP-hr} = M_{\text{AL mode}} / \text{Measured BHP in mode.}$

(viii) $E_{\text{AL mode}} = \text{Aldehydes grams/BHP-hr} = M_{\text{AL mode}} / \text{Measured BHP in mode.}$

Where:

$M_{\text{AL mode}} = \text{Total aldehyde mass emissions (grams per hour) for each test mode.}$

(2) Mass Emissions—Raw exhaust measurements. For raw exhaust measurements mass emissions (grams per hour) of each species for each mode:

(i) General equations. (A) The mass emission rate, $M_{X \text{ mode}}$ (g/hr), of each pollutant (HC, NO_x , CO_2 , CO, CH_4 , CH_3OH , $\text{CH}_3\text{CH}_2\text{OH}$, CH_2O , $\text{CH}_3\text{CH}_2\text{O}$) for each operating mode for raw measurements is determined based on one of the following equations:

$$M_{X \text{ mode}} = (DX/10^6)(DV_{\text{ol}})(MW_X/V_m)$$

$$M_{X \text{ mode}} = (WX/10^6)(WV_{\text{ol}})(MW_X/V_m)$$

Where:

X designates the pollutant (e.g., HC), DX is the concentration of pollutant X (ppm or ppmC) on a dry basis, MW_X is the molecular weight of the pollutant (g/mol), DV_{ol} is the total exhaust flow rate (ft^3/hr) on a dry basis, WX is the concentration of pollutant X (ppm or ppmC) on a wet basis, WV_{ol} is the total exhaust flow rate (ft^3/hr) on a wet basis, V_m is the volume of one mole of gas at standard temperature and pressure (ft^3/mol).

(B) All measured volumes and volumetric flow rates must be corrected to standard temperature and pressure prior to calculations.

(ii) The following abbreviations and equations apply to this paragraph (b)(2):

α = Atomic hydrogen/carbon ratio of the fuel.

β = Atomic oxygen/carbon ratio of the fuel.

CMW_f = Molecular weight of the fuel per carbon atom, or carbon molecular weight (g/moleC) = $(12.011 + 1.008\alpha + 16.000\beta)$.

$= (V_m)(W_f) / ((\text{CMW}_f)(\text{DHC}/10^6 + \text{DCO}/10^6 + \text{DCO}_2/100))$.

K = Water gas equilibrium constant = 3.5.

WCO_2 = CO_2 concentration in exhaust, percent (wet).

WHC = HC concentration in exhaust, ppm C (wet).

WV_{ol} = Total exhaust flow rate (ft^3/hr) on a wet basis; or

$= (V_m)(W_f) / ((\text{CMW}_f)(\text{WHC}/10^6 + \text{WCO}_2/100))$.

(iii) Calculation of individual pollutant masses. Calculations for mass emission are shown here in multiple forms. One set of equations is used when sample is analyzed dry (equations where the concentrations are expressed as DX), and the other set is used when the sample is analyzed wet (equations where the concentrations are expressed as WX). When samples are analyzed for some constituents dry and for some constituents wet, the wet concentrations must be converted to dry concentrations, and the equations for dry concentrations used. Also, the equations for HC, NMHC, CO, and NO_x have multiple forms that are algebraically equivalent: An explicit form that requires intermediate calculation of V_m and DV_{ol} or WV_{ol} ; and an implicit form that uses only the concentrations (e.g., DCO) and the mass flow rate of the fuel. For these calculations, either form may be used.

(A) Hydrocarbons and nonmethane hydrocarbons.

(1) Hydrocarbons. (i) For petroleum-fueled engines:

$$M_{\text{HC mode}} = (\text{DHC})\text{CMW}_f(DV_{\text{ol}})(10^6)/V_m$$

$$M_{\text{HC mode}} = (\text{WHC})\text{CMW}_f(WV_{\text{ol}})(10^6)/V_m$$

$$= ((\text{WHC}/10^6)(W_f) / ((\text{WCO}/10^6) + (\text{WCO}_2/100) + (\text{WHC}/10^6) + (\sum(WX/10^6))))$$

(1) If aldehydes are measured using impingers:

$$\text{DCH}_2\text{O} = (V_m)(10^6)[(C_1 \times AV_1) + (C_2 \times AV_2)]/DV_{\text{VolFS}}$$

$$\text{DCH}_3\text{CHO} = (V_m)(10^6)[(C_1 \times AV_1) + (C_2 \times AV_2)]/DV_{\text{VolAS}}$$

$$\text{WCH}_3\text{CHO} = (V_m)(10^6)[(C_1 \times AV_1) + (C_2 \times AV_2)]/WV_{\text{VolAS}}$$

(2) If aldehydes are measured using cartridges:

$$\text{DCH}_3\text{CHO} = (V_m)(10^6)(C_R \times AV_R)/DV_{\text{VolAS}}$$

$$\text{WCH}_3\text{CHO} = (V_m)(10^6)(C_R \times AV_R)/WV_{\text{VolAS}}$$

DV_{VolAS} = Volume (standard ft³) of exhaust sample drawn through acetaldehyde sampling system (dry).

WV_{VolAS} = Volume (standard ft³) of exhaust sample drawn through acetaldehyde sampling system (wet).

(iv) Conversion of wet concentrations to dry concentrations. Wet concentrations are converted to dry concentrations using the following equation:

$$DX = K_w WX$$

Where:

WX is the concentration of species X on a wet basis.

DX is the concentration of species X on a dry basis.

K_w is a conversion factor = $WV_{\text{Vol}}/DV_{\text{Vol}} = 1 + \text{DH}_2\text{O}$.

(A) Iterative calculation of conversion factor. The conversion factor K_w is calculated from the fractional volume of water in the exhaust on a dry basis (DH_2O = volume of water in exhaust/dry volume of exhaust). Precise calculation of the conversion factor K_w must be done by iteration, since it requires the dry concentration of HC, but HC emissions are measured wet.

(1) The conversion factor is calculated by first assuming $\text{DHC} = \text{WHC}$ to calculate DV_{Vol} :

$$DV_{\text{Vol}} = (V_m)(W_f)/((\text{CMW}_f)(\text{DHC}/10^6 + \text{DCO}/10^6 + \text{DCO}_2/100))$$

(2) This estimate is then used in the following equations to calculate DV_{Volair} , then DH_2O , then K_w , which allows DHC to be determined more accurately from WHC :

(c) *Humidity calculations.* (1) The following abbreviations (and units) apply to paragraph (b) of this section:

BARO=barometric pressure (Pa).

H=specific humidity, (g H₂O/g of dry air).K_H=conversion factor=0.6220 g H₂O/g dry air.M_{air}=Molecular weight of air=28.9645.M_{H₂O}=Molecular weight of water=18.01534.P_{DB}=Saturation vapor pressure of water at the dry bulb temperature (Pa).P_{DP}=Saturation vapor pressure of water at the dewpoint temperature (Pa).P_v=Partial pressure of water vapor (Pa).P_{WB}=Saturation vapor pressure of water at the wet bulb temperature (Pa).T_{DB}=Dry bulb temperature (Kelvin).T_{WB}=Wet bulb temperature (Kelvin).

Y=Water-vapor volume concentration.

(2) The specific humidity on a dry basis of the intake air (H) is defined as:

$$H = \frac{(K_H)(P_v)}{(BARO - P_v)}$$

(3) The partial pressure of water vapor may be determined using a dew point device. In that case:

$$P_v = P_{DP}$$

(4) The percent of relative humidity (RH) is defined as:

$$RH = \frac{P_v}{P_{DB}} 100$$

(5) The water-vapor volume concentration on a dry basis of the engine intake air (Y) is defined as:

$$Y = \frac{(H)(M_{air})}{(M_{H_2O})} = \frac{P_v}{(BARO - P_v)}$$

(d) *NO_x correction factor.* (1) NO_x emission rates ($M_{NO_x, mode}$) shall be adjusted to account for the effects of humidity and temperature by multiplying each emission rate by K_{NO_x} , which is calculated from the following equations:

$$K_{NO_x} = (K)(1 + (0.25(\log K)^2)^{1/2})$$

$$K = (K_H)(K_T)$$

$$K_H = \frac{[C_1 + C_2(\exp((-0.0143)(10.714))]}{[C_1 + C_2(\exp((-0.0143)(1000H))]}$$

$$C_1 = -8.7 + 164.5 \exp(-0.0218(A/F)_{wet})$$

$$C_2 = 130.7 + 3941 \exp(-0.0248(A/F)_{wet})$$

Where:

$(A/F)_{wet}$ = Mass of moist air intake divided by mass of fuel intake.

$K_T = 1/[1 - 0.017(T_{30} - T_A)]$ for tests conducted at ambient temperatures below 30 °C.

$K_T = 1.00$ for tests conducted at ambient temperatures at or above 30 °C.

T_{30} = The measured intake manifold air temperature in the locomotive when operated at 30 °C (or 100 °C, where intake manifold air temperature is not available).

T_A = The measured intake manifold air temperature in the locomotive as tested (or the ambient temperature (°C), where intake manifold air temperature is not available).

(e) *Other calculations.* Calculations other than those specified in this section may be used with the advance approval of the Administrator.

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 272

[FRL-7092-1]

Utah: Final Authorization of State-Initiated Changes and Incorporation by Reference of State Hazardous Waste Management Program

AGENCY: Environmental Protection Agency (EPA).

ACTION: Immediate final rule.

SUMMARY: During a review of Utah's regulations, EPA identified a variety of

State-initiated changes to Utah's hazardous waste program under the Resource Conservation and Recovery Act (RCRA). We have determined that these changes are minor and satisfy all requirements needed to qualify for Final authorization and are authorizing the State-initiated changes through this Immediate Final action. In addition, today's document corrects technical errors made in the tables published in the May 23, 1991 **Federal Register** (as amended August 6, 1991), October 14, 1994, and January 13, 1999 authorization documents for Utah.

EPA uses the Section of the Code of Federal Regulations (CFR) entitled Approved State Hazardous Waste Management Programs to incorporate by reference those provisions of the State regulations that are part of the authorized State program. This document incorporates the newly authorized State program into the regulations entitled Approved State Hazardous Waste Management Programs and clarifies which of these provisions we have authorized and will enforce under sections 3008, 3013, and 7003 of RCRA.

DATES: This Final authorization for Utah and incorporation by reference of the Utah authorized hazardous waste program will become effective on January 25, 2002, unless EPA receives adverse written comment by December 26, 2001. The Director of the Federal Register approves the incorporation by reference of the Utah regulations contained in this rule as of January 25, 2002 in accordance with 5 U.S.C. 552(a) and 1 CFR part 51.

ADDRESSES: Send written comments to Kris Shurr, 8P-HW, U.S. EPA, Region VIII, 999 18th St., Suite 300, Denver, Colorado 80202-2466, phone number: (303) 312-6139. SUPPLEMENTARY INFORMATION:

I. Authorization of State-Initiated Changes

A. Why Are Revisions to State Programs Necessary?

States which have received Final authorization from EPA under RCRA section 3006(b), 42 U.S.C. 6926(b), must maintain a hazardous waste program that is equivalent to, consistent with, and no less stringent than the Federal hazardous waste program. As the Federal program changes, the States must change their programs and ask EPA to authorize the changes. Changes to State hazardous waste programs may be necessary when Federal or State statutory or regulatory authority is modified or when certain other changes occur. Most commonly, States must change their programs because of changes to EPA's regulations in 40 CFR parts 124, 260 through 266, 268, 270, 273 and 279. States can also initiate their own changes to their hazardous waste program and these changes must then be authorized.

B. What Authorization Decisions Have We Made in This Rule?

We conclude that Utah's revisions to its authorized program meet all of the statutory and regulatory requirements established by RCRA. We found that the State-initiated changes make Utah's rules more clear or conform more closely to the Federal equivalents and are so minor in nature that a formal application is unnecessary. Therefore, we grant Utah Final authorization to operate its hazardous waste program with the changes described in the table at item I.G. of this document. Utah has responsibility for permitting Treatment, Storage, and Disposal Facilities (TSDFs) within its borders (except in Indian Country) and for carrying out all authorized aspects of the RCRA program, subject to the limitations of the Hazardous and Solid Waste Amendments of 1984 (HSWA). New Federal requirements and prohibitions imposed by Federal regulations that EPA promulgates under the authority of HSWA take effect in authorized States before they are authorized for the requirements. Thus, EPA will implement those requirements and prohibitions in Utah, including issuing permits, until the State is granted authorization to do so.

C. What Is the Effect of Today's Authorization Decision?

The effect of this decision is that a facility in Utah will continue to be subject to the authorized State requirements instead of the equivalent Federal requirements in order to comply
