**History and Description of the Human Remains**

In 1956, human remains representing, at minimum, nine individuals were removed from the White Rapids site (20ME3), in Menominee County, MI, during an excavation conducted by an archeologist from the University of Michigan Museum of Anthropological Archaeology. The site consists of a pair of mounds located near the Menominee River in the Menominee State Forest. Human remains and associated funerary objects were removed from Mound 2, which contained three separate burial episodes designated as Features 1, 2, and 3. Feature 1 is described as an extended adult female burial. Feature 2 is described as containing charred human remains from several long bones representing multiple individuals. Feature 3 is described as fragmentary human remains from a disturbed burial. The human remains removed from the site are one young adult 19–30 years old, female; one adult, female; one child 9–10 years old; one older adult 40+ years old, indeterminate sex; one cremated adult, indeterminate sex; one older adult 40+ years old, possible male; one adult, possible female; one cremated adult, possible male; and one cremated adult 35–49 years old, female. The burials date to the Late Woodland Period (500–1400 A.D.) based on burial treatment. No known individuals were identified. The six associated funerary objects are one lot of charred wood; one lot of charcoal, soil, and unworked pebbles; one lot of ashes; one lot of charcoal; one lot of fire-cracked rock; and one lot of grit-tempered and decorated ceramic sherd.

The human remains have been determined to be Native American based on cranial morphology, accession documentation, and archeological context. A relationship of shared group identity can be reasonably traced between the Native American human remains from this site and the Menominee Indian Tribe of Wisconsin, based on the site’s location within the lands traditionally occupied by the Menominee. Moreover, according to oral tradition and historical accounts, the
