

dollar per person-rem conversion factor for fatality risks detailed in NUREG–1530, Revision 1, “Reassessment of NRC’s Dollar Per Person-Rem Conversion Factor Policy,” issued February 2022. The evaluation of morbidity impacts of nonfatal cancers will provide a more complete and realistic treatment of potential health effects due to radiation exposure in NRC cost-benefit analyses.

Appendix L, “Replacement Energy Costs,” provides guidance on how to apply information in NUREG–2242, “Replacement Energy Cost Estimates for Nuclear Power Plants: 2020–2030,” issued June 2021, to estimate replacement energy costs associated

with regulatory actions that may result in the temporary or permanent loss of electrical power generation from a nuclear reactor. The term “replacement energy cost” refers to the change in wholesale power prices that could result when a reactor unit is taken offline. This appendix presents methods and examples showing how to use the information in NUREG–2242 to (1) quantify replacement energy costs in cost-benefit analyses, including the calculation of shutdown costs related to installing or implementing mandated safety changes, and (2) estimate present value of averted onsite costs due to changes in reactor accident frequencies.

The NRC staff plans to hold a public information meeting with a question and answer session to discuss these draft appendices to NUREG/BR–0058, Revision 5. The public meeting will be noticed on the NRC’s public meeting website at least 10 calendar days before the meeting. Members of the public should monitor the NRC’s public meeting website at <https://www.nrc.gov/pmns/mtg> for additional information.
