

upper powerhouse is manually operated and serves as a backup to the lower powerhouse when inflows exceed the hydraulic capacity of the lower powerhouse (*i.e.*, 860 cubic feet per second [cfs]).² The minimum and maximum hydraulic capacities of the project are 232 cfs and 1,090 cfs, respectively.

A continuous minimum flow of 45 cfs or inflow, whichever is less, is passed into the bypassed reach. The minimum flow comprises 30 cfs at the spillway and 15 cfs of leakage flow from the upper powerhouse. Project operation ceases when inflow falls below the project's minimum hydraulic capacity and all flow is passed via a minimum flow weir³ and/or over the project spillway. From 2010 to 2020, the project generated an average of 27,865 megawatt-hours annually.
