II. Discussion

As directed in SRM–SECY–11–0089, “Options for Proceeding with Future Level 3 Probabilistic Risk Assessment (PRA) Activities,” the staff is conducting a full-scope multi-unit site

Level 3 PRA (Level 3 PRA project) that addresses all internal and external hazards; all plant operating modes; and all reactor units, spent fuel pools, and dry cask storage (DCS). The reference site for this study contains two four-loop Westinghouse pressurized water reactors with large dry containments. The objectives of the Level 3 PRA project are to (1) develop a Level 3 PRA, generally based on current state-of-practice methods, tools, and data, that (a) reflects technical advances since the last NRC-sponsored Level 3 PRAs (NUREG–1150), which were completed over 30 years ago, and (b) addresses scope considerations that were not previously considered (*e.g.*, low-power and shutdown risk, multi-unit risk, other radiological sources); (2) extract new insights to enhance regulatory decision making and to help focus limited NRC resources on issues most directly related to the agency’s mission to protect public health and safety; (3) enhance PRA staff capability and expertise and improve documentation practices to make PRA information more accessible, retrievable, and understandable; and (4) demonstrate technical feasibility and evaluate the realistic cost of developing new Level 3 PRAs.

The work performed under this project is being documented as a multi-volume report. The current Level 3 PRA project report (Volume 7) describes the analyses and results for the DCS PRA. The Level 3 PRA project DCS PRA is a site-specific and cask-specific analysis that consists of the following interrelated technical elements: initiating event analysis, structural analysis, thermal analysis, human reliability analysis, multipurpose canister failure analysis, systems analysis, consequence analysis, and risk results quantification. The study predicted that there would be no prompt fatalities from DCS within 10 miles of the site. Results are reported for several other consequence metrics, including individual latent cancer fatality risk, total latent cancer fatality cases, population dose from 0–50 miles and 0–100 miles, economic cost, and population affected by intermediate phase relocation. Regardless of the consequence metric, the risk from DCS operations was calculated to be very low.
